

Revamp60Seconds: Project Execution Plan & Task Assignments

Company Administration

September 2026

Company Policies and Agreements

Task Management & Scheduling

Tasks are exclusively generated by designated Architectural Coordinators or the Manager. Depending on the complexity and scope, tasks are allocated either a standard two-week sprint or a one-month extended completion timeframe.

Attribution & Revenue Sharing

All final overarching project credits are officially attributed to the Manager. However, every active project contributor will be explicitly credited under their real name across all distribution platforms where the game is published.

Furthermore, all contributing team members will receive a designated portion of the sales revenue for the first three years post-launch. Beginning in the fiscal year 2029, all sales revenue will revert solely to the Manager to fund ongoing game promotion and validate the foundational efforts of the company's workforce.

Legal & Marketing Liability

All legal responsibilities, proactive marketing initiatives, and associated corporate consequences are formally assumed under the name of the Manager, **Tompea Maria-Daria**, and the Second Manager, [.....].

Architectural Worker 1

Architectural Worker 2

First Assignment Sprint

Duration: September 1, 2026 – September 25, 2026

Programmer Responsibilities

Login Page & Authentication

Develop the initial login interface featuring four primary functional pathways:

1. **Login with Existent Key:** Users authenticate using a pre-purchased key generated by our secure database. (*Note: A separate web portal for key purchasing will be developed in a future assignment.*) For immediate testing purposes, developers must input 10 hardcoded valid keys into the database to allow project members immediate access with credentials. The system must actively validate the entered key against the database.
2. **Keep Me Logged In:** A selectable checkbox widget. If checked, the user bypasses the login screen on subsequent client launches. If left unchecked, credentials must be re-entered upon every launch.
3. **Start Chronometered Trial:** Grants new users a 3-hour free trial upon installation. Once the internal timer expires, the game forcibly pauses and prompts: *"You have used your free trial. To continue, please log in with a pre-purchased key and your credentials."*
4. **Sign Up:** For new users without an account. Registration requires inputting a Username, Email, Password, and a valid Pre-purchased Key.

Main Menu & Difficulty Selection

- **Layout Construction:**
 - **Left Sidebar (33%-40% width):** Display the game title (temporary placeholder: *Revamp60Seconds*) along with standard navigation buttons: **Play**, **Character List**, **Account Settings**, and **Logout**.
 - **Right Main Area (60%-66% width):** Implement a dynamic background video player that smoothly crossfades and loops between three pre-rendered images provided by the art team.
- **Difficulty Selection (*Play Button Flow*):** Pressing 'Play' replaces the main menu with difficulty options. Hovering over each difficulty dynamically updates a tooltip description:
 - **ROBOT:** *Tutorial covering the basics of the game for new players. All items and game mechanics are introduced.*
 - **EASY:** *Characters are less susceptible to sickness and fatigue. Food and helpful survivors are plentiful. We've hit the jackpot with scavenging luck.*
 - **MEDIUM:** *We were able to gather enough resources to survive initially, but the sea is vast. Finding new resources is uncertain, and people grow weaker by the day.*

- **HARD:** *The sea is unforgiving as we struggle to survive on limited resources. Sickness and exhaustion are frequent companions.*
- **NIGHTMARE:** *The curse of the sea shows no mercy; it seems to actively hunt us down. Do you dare take the challenge?*

Character List & Database Architecture

- **Character Roster UI:**

- Clicking 'Character List' transitions to a scrollable grid/list displaying character names and portraits.
- Initially, the first four characters (A, B, C, D) are unlocked; remaining unowned characters are greyed out and display a padlock icon.
- Clicking an unlocked character displays a detail popup with their lore and statistics.
- Clicking a locked character triggers a popup stating: *"You must first own this character to check its story and lore."* Clicking anywhere outside the popup dismisses it.

- **Character Database Schema:**

- **Base Attributes:** Name, Description.
- **Core Stats (Ranked A, B, C):** IQ (Initial 4: Rank C), Strength (Initial 4: Rank C), Sickness Resistance Rate (Initial 4: Rank C).
- **Dynamic Stats:** Sickness Ratio (Default: 0%), Tiredness Rate (Default: 0%), Sanity (Default: 100%).
- **Image States:** Each character entry requires four distinct visual states in the database corresponding to conditions: Sane, Insane, Sick, Tired.
- **State Override Logic:** The active character portrait is determined by their most severe debuff. For example, if a character has 50% sickness but 0% sanity, the "Insane" portrait takes highest priority and is displayed globally.

Artist Responsibilities

Login Interface Aesthetics

- **Background Matte:** Design a highly detailed, thematic pirate map background. (*Reference the MAP.txt document in the TASKS folder for specific element descriptions and structural requirements*).
- **UI Elements:** Design a clean, simple 'Login' button accented with subtle, thematic marine features (e.g., stylized tentacles along the border). The 'Sign-Up' bar and overall menu styling must maintain strict visual consistency with these login assets.

Main Page Looping Backgrounds

Create three distinct, high-quality illustrations designed to crossfade and loop smoothly in the main menu background video:

1. A naval ship viewed directly from the front at a 45-degree elevated angle.
2. A lush tropical island scene featuring a siren partially concealed behind a tree, positioned alongside an ornate treasure chest.
3. A 60-degree top-down perspective looking at a wooden occult table. The table must feature an open spellbook bearing a magical sign (*Reference **OCCULT.txt** for design hints and rough sketches*), an atmospheric skull, and other esoteric nautical artifacts.

Difficulty Selection Icons

Design simple, elegant iconography for the difficulty setting buttons.

- Standard buttons should incorporate small thematic symbols (e.g., a stylized anchor, a fish).
- The **NIGHTMARE** difficulty button must prominently feature a menacing demonic eye.
- Despite variations, all icons must look completely cohesive and clearly belong to the same UI asset bundle.

Detailed Task Assignments & Workload

Name	Task Description	
Maria-Daria Tompea (Manager)	• Create the first 3 simple scenarios, each containing at least 4 day-steps (progression requires meeting the previous lore of the related scenario on at least one day). • Create the initial, non-randomized starting scenario for all difficulties (excluding Tutorial, which requires no initial lore). • Contribute to art direction: provide design sketches, ensure stylistic consistency, and maintain up-to-date documentation. • Draw one of the three main looping background images and the occult table image. • Create the architectural structure/diagram for the login page and main menu to guide the programmers. • Write the basic database descriptions and core stats for the first 4 default characters. • Communicate with digital artists regarding character aesthetics and finalize the drawing descriptions.	
Illayda (Programmer)	Execute 33% of the total programming sprint tasks (Login Page, Main Menu UI, Difficulty Selection, and Character Database logic).	
Scuty (Programmer)	Execute 33% of the total programming sprint tasks (Login Page, Main Menu UI, Difficulty Selection, and Character Database logic).	
Eclipse (Programmer)	Execute 33% of the total programming sprint tasks (Login Page, Main Menu UI, Difficulty Selection, and Character Database logic).	
VikiPéDia (Artist)	Execute 45% of the remaining artistic workload (including login UI assets, difficulty icons, and the remaining looping background images).	
Puputeve (Artist)	Execute 45% of the remaining artistic workload (including login UI assets, difficulty icons, and the remaining looping background images).	

Specific Task Allocations (Table 2)

Name	Granular Task Allocation	
Maria-Daria Tompea (Manager)	Refer to the comprehensive tasks detailed above in Table 1.	
Illayda (Programmer)	Login Page & Authentication System: • Build the UI for the 4 primary login pathways. • Implement the database validation logic for the 10 hardcoded test keys. • Code the client-side “Keep Me Logged In” persistence bypass logic. • Develop the internal 3-hour chronometer timer and the pause/prompt interruption flow for the free trial. Database Tables to Implement: • Users: to store <code>username</code>, <code>email</code>, <code>password_hash</code>, <code>pre_purchased_key</code>, and <code>trial_start_time</code>. • ValidKeys: to store the generated/hardcoded valid game keys for authentication.	
Scuty (Programmer)	Main Menu UI & Difficulty Flow: • Build the 33/66 split-screen responsive layout for the main menu. • Integrate the crossfading/looping video background player into the right-side container. • Implement the 'Play' button view-state swap for the difficulty selection menu. • Code the dynamic hover tooltip logic and text injection for all 5 difficulty settings (ROBOT to NIGHTMARE). Database Tables to Implement: • PlayerProgress: to store the user's <code>user_id</code>, <code>selected_difficulty</code>, and <code>highest_difficulty_unlocked</code> (if applicable). • GameSettings: to store user preferences and <code>keep_me_logged_in</code> client state if mapped to the DB.	
Eclipse (Programmer)	Character Database & Roster UI: • Build the scrollable character roster UI, including padlock overlays, lock warnings, and detailed lore popups. • Design the underlying data structures for Core Stats (IQ, Strength, etc.) and Dynamic Stats (Sanity, Sickness, etc.). • Program the “State Override Logic” to actively determine and display the correct character portrait based on their most severe active debuff. Database Tables to Implement: • Characters: to store <code>character_id</code>, <code>name</code>, <code>description</code>, and core stat ranks (<code>iq_rank</code>, <code>strength_rank</code>, <code>sickness_rate_rank</code>). • PlayerCharacters: to track <code>user_id</code>, <code>character_id</code>, and <code>is_unlocked</code> status. 6 • CharacterStates: to link <code>character_id</code> with specific state image references (<code>sane_img</code>, <code>insane_img</code>, <code>sick_img</code>, <code>tired_img</code>).	

Specific Task Allocations (Artists)

Name	Granular Task Allocation
VikiPéDia (Artist)	Login Assets & UI Iconography: • Paint the highly detailed Pirate Map background for the login screen. • Design the stylized Login and Sign-Up buttons featuring subtle marine/tentacle elements. • Create the 5 difficulty setting icons (anchors/fish for standards, a demonic eye for NIGHTMARE).
Puputeve (Artist)	Main Menu Background Illustrations: • Paint the naval ship viewed directly from the front at an elevated 45-degree angle. • Paint the lush tropical island scene featuring a partially concealed siren and a treasure chest. • Ensure both illustrations strictly match the project's visual style and are formatted for seamless crossfade looping.
